Objectives

- **design processes organized in several workflows;**
- **develop medium size workflows using various collection types (array, lists, dictionaries, data tables);**
- **use of I/O-based activities for .csv and .txt files.**

Task	Description
[individual/team] **Multiple workflows** **[due: Lab03]**	Create a workflow in UiPath Studio. Make use of the following concepts discussed in **Lecture 03**, considering at least the followings: 1. min. 2 related workflows that are *invoked* (used) by the main workflow; 2. use different argument *data types* and *directions* (in, out, in/out); 3. read and write from a **.csv** or **.txt** file (or another file type); recommended activities to be used: **Read Text File, Write Text File, Write Line, Append Line, Read CSV, Write CSV**. The workflow will correspond to a process that performs a list of steps to achieve a meaningful goal, e.g., solve a (math) problem, several rule-based actions that accomplish various related tasks. **Notes:** In order to achieve the tasks required for this assignment, students can work on the project prepared for Lab01 and improve it. Here are several ways to do that: • add new features/capabilities to the process; • allow different ways to input/output data (standard i/o, files); • use different collections than those employed in Lab01; • refactor the initial workflow in several workflows (new workflows will have smaller complexity); • design a new process using the top-down approach allowing you to develop several workflows that call/use each other.

Recommended readings:

- from the **RPA Developer Foundation** learning plan skim the followings lessons:
  - **Variables and Arguments in Studio** (1h30m)
  - **Control Flow in Studio** (2h)
  - **Data Manipulation with Strings in Studio** (1h)
  - **Data Manipulation with Lists and Dictionaries in Studio** (1h20min)
